

THE SOLUTIONS READY

Configurable applicatives directly from **HMI**

Reduced time in making machine operable and in immission the machine on the market

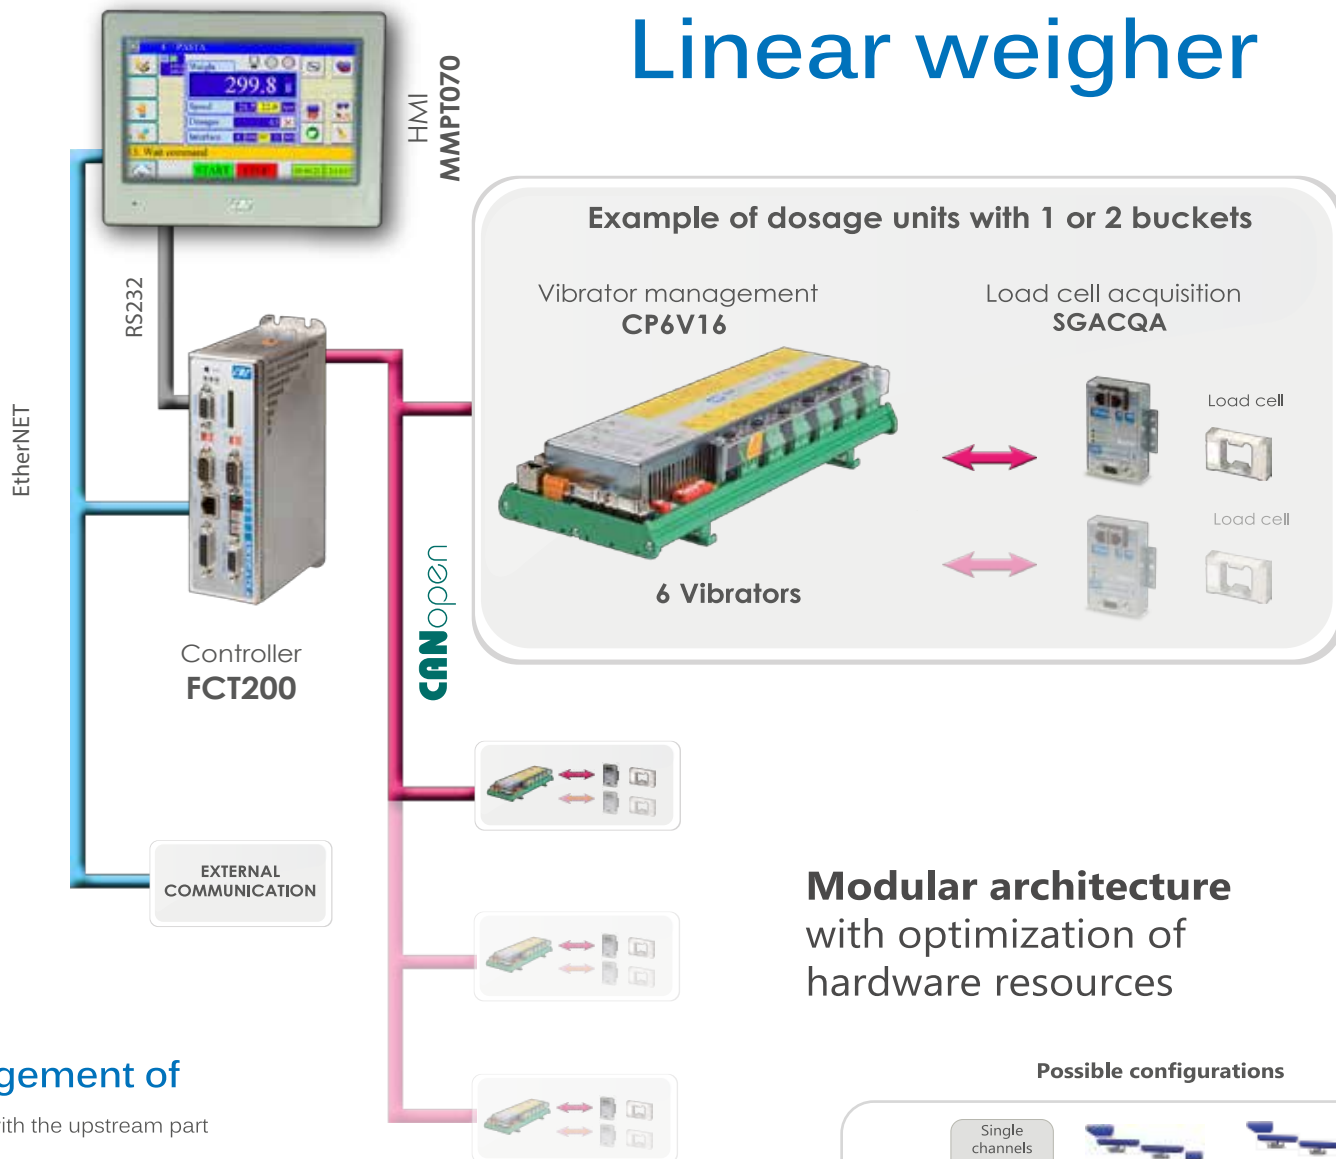

Reduced investment by the OEM in SW development

Not programmer required in making machine operable

Possibility for the customer to directly modify the machine functionalities

Linear weigher

Example of dosage units with 1 or 2 buckets

Vibrator management **CP6V16**

6 Vibrators

Load cell acquisition **SGACQA**

Load cell

Load cell

Management of

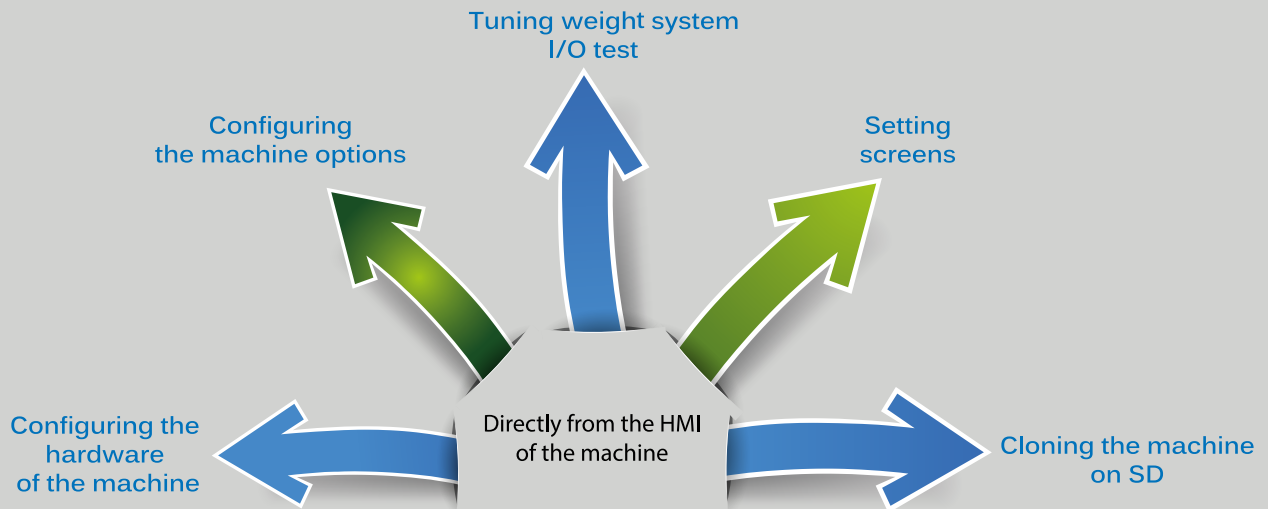

- Interface with the upstream part
- Uplift belt
- Loading hopper (vibrating with level sensor)
- Two levels of loading (vibrating)
- Coarse and precise feeding (with vibrating device or belt)
- Blow for product discharge
- Sensor for open/closed buckets
- Control signals with the rest of the line
- Check weigher feedback

Modular architecture with optimization of hardware resources

Possible configurations

The CMZ configurable applicative foresees all the features of a standard machine easily activated without programming software experience

Software features

- Multilanguage graphical interface, comprehensive and intuitive
- Access to pages with customizable login and password
- Unique configurable software without the need for revisions sw for each model of packaging machine
- Dynamic mapping of HW devices by HMI
- Operator interface automatically composed according to the devices and to the operating mode setted
- Setting of all operating parameters according to the access privilege and/or parameter settings such as general data or recipe
- Management of 100 recipes resident in memory expandable on SD card and identified by number and alphanumeric codes
- Recipe management protected, depending on the active password level and recipe management prototype
- Management of data back up
- Data management: security, export, import and format standard
- Setting the parameters of the devices and characterization recipe even while the machine cycling
- Detailed diagnostics on HMI of hardware and software components, manual testing of various devices, simulation
- Possibility of connection of the machine in Ethernet networks
- Manament of the output belt, control signals with the rest of the line
- Possibility of simulating the operation in cycle and signals Interface
- Statistical survey of average weight, standard deviation and total weight unloaded, histograms of weights downloaded
- Commands for clean the machine and dosage for the end of production

Example displays
